

# Stopwatch

## Overview

This page was updated in 2020 to use the SevenSegmentShield library. For a download and more information, follow [this guide](#).

This code uses the [Gravitech seven-segment shield](#)

## Code

This is a simple program that counts up every second and displays the counter on the segments, similar to a stopwatch.

```
/*
  Stopwatch
  Displays numbers on a seven segment display shield like a stopwatch.
  Parts required:
  Arduino Uno
  Seven segment shield
*/

#include <SevenSegmentShield.h> // Include shield library
#include <Wire.h> // Include Wire library for I2C

Display ds; // Create Display object to use
int count = 0; // The variable to display

void setup() {
  Wire.begin(); // Init I2C bus
  ds.begin(); // Init display
}

void loop() {
  ds.displayInt(count++); // Increment count and display on segments
  delay(1000); // Wait one second before continuing
}
```
